

***** Must have TS / SCI with Polygraph to be considered for this opportunity. *****

The Systems Integrators will use their broad technical knowledge to design, build and deploy networked systems used for classified communication. Design of these systems will require a total systems perspective including a technical understanding of relationships, dependencies and requirements of hardware and software components. Security requirements will be incorporated into the design of new systems, and if necessary, updates will be made to existing systems.

As a Systems Integrator you will analyze, test and evaluate systems such as local area networks (LANs), wide area networks (WANs), the Internet, intranets, and other data communications systems. The scale of these systems can range from a connection between two nodes in the same building to globally distributed networks, voice mail, and e-mail systems of a multinational organization. Additional tasks will include network modeling, analysis, and planning including research related products and make necessary hardware and software improvements and upgrades.

Responsibilities will include:

- Preparing engineering plans and site installation technical design packages.
- Working with engineers, systems analysts, programmers, technicians, scientists, and top-level managers in the design, testing, and evaluation of systems.
- Monitoring network to ensure network availability to all system users and perform necessary maintenance to support network availability.
- Managing efforts of a staff engaged in facility additions, moves or changes including analysis, telecommunications (LAN, WAN, voice, video) planning and cabling.
- Using Program Management Framework (PMF) to monitor and review costs, operational budgets, schedules and fluctuating work force demands.
- When required will supervise other network support and client server specialists and plan, coordinate, and implement network security measures.

To be considered you will have experience with most if not all of the following:

- 4 + years of experience working in multivendor and multiprotocol network environments.
- 2 + years managing SLAs, developing metrics, data collection / reporting as needed.
- Demonstrated competency deploying LAN /WAN solutions in a classified environment.
- Hands on experience with a variety of technologies to include: DNS, HTTPS, Firewalls, MPLS, IP v4 & v6, VPNs.
- Verifiable success using PMF, MS Project and/or Visio to monitor progress and ensure on time completion of projects.

Required Education:

- Bachelor's Degree or higher in Business Systems or related field of study with at least 4 years applicable experience. Senior level positions require additional years experience
- Preference given to candidates with CCIE, JNCIE, CCNA, JNCIA certifications.

For immediate consideration please submit resumes to:
